Video games have been around for a long time. Since the 1970's or earlier! The first video games were arcades, like, Atari's pong. And then, a company named Magnavox made the first video game system, the Odyssey. A simple machine that wasn't really that great graphic wise, but, it was a great advancement in video game technology! In 1985, Nintendo introduced the Nintendo Entertainment System, and that changed everything! By introducing a controller, reproducing it authentically, and aggressively pricing it so they can make a profit. This made video games popular in the market, and it continues onto today.

Some facts about video games are; Sega's dreamcast being the first console to have online play. Microsoft's xbox was the first to provide hdtv support. The Nintendo n64 marked the first time that Silicon Graphics Inc. (SGI) developed game hardware tech. The Atari Pong video game console was the No. 1 selling item for the holiday season in 1975. And Nintendo's Game Boy was the most successful game system ever, with more than 100 million units sold worldwide.
