

I am planning on creating a website based on my research of the Permian Extinction event that happened 232 million years ago. This extinction was before the dinosaurs iconic meteor strike, and is considered the worst extinction of all time. Caused by worldwide overactive volcanic and tectonic plate movement, 95% of all life was killed, compared to the 75% of Cretaceous life that was killed in the age of the dinosaurs. I want to highlight this part of history because it fascinates me, well natural history does in general and this part of time is often not taught mainstream.

After a splash page with a hook, I plan to feature the Lystrosaurs, the most successful animal at the time, and a timeline of events. Three pages, one covering the volcanic activity, fallout and survivors. My audience is people interested in history, or who have not heard of this part of history. I only learned about it a few years ago to be honest. My design will feature dark colors of ash, red lava, and green to show hope. I will find images and videos for my topic. I am not sure if I will make a logo, but I am leaning against it right now.
