

Hash Functions

Benjamin Pecson

11/20/2019

Cryptographic Hash Functions should have the following three properties:

- Preimage Resistance
- Weak Collision Resistance
- Strong Image Resistance

The Discrete Logarithm Hash has strong image resistance.

The Discrete Logarithm Hash is comprised of:

- Two primes, p and q
Where, $p=2q+1$
- Two different Primitive Roots:
Alpha and Beta, where:

$$- \alpha^a \equiv \beta \pmod{p}$$

$$- \beta^b \equiv \alpha \pmod{p}$$

Finidng a and b in the equations above is difficult.

Hash a message m which is less than q^2

$$h(m) < p$$

The input produces a digest such that $m < p$

Hash Function: $h(m) = h(x_1 + x_2 * q) \equiv \alpha^{x_1} \beta^{x_2} \pmod{p}$

$m < q^2$, so write m in base q

Where $m = x_1 + x_2 * q$
and $0 \leq x_1, x_2 < q$

How to prove this hash function is preimage resistant:

If we can find a collision to this discrete log hash then we can use the discrete log problem $\alpha^a \equiv \beta \pmod{p}$

Suppose a collision is found:

$m = x_1 + x_2 * q,$
where $m' = m',$
but $m' = y_1 + x_2 * q,$
and $h(m) = h(m')$

$$\begin{aligned}\alpha^{x_1} \beta^{x_2} &\equiv \alpha^{y_1} \beta^{y_2} \pmod{p} \\ \alpha^{x_1} (\alpha^a)^{x_2} &\equiv \alpha^{y_1} (\alpha^a)^{y_2} \pmod{p} \\ \alpha^{x_1 + ax_2} &\equiv \alpha^{y_1 + ay_2} \pmod{p} \\ \alpha^{(x_1 - y_1 + a(x_2 - y_2))} &\equiv 1 \pmod{p}\end{aligned}$$

Because p is a primitive root,

$$p - 1 \mid (x_1 - y_1 + a(x_2 - y_2))$$

$$(x_1 - y_1 + a(x_2 - y_2)) \equiv 0 \pmod{p-1}$$

$$a(x_2 - y_2) \equiv -(x_1 - y_1)(y_1 - x_1) \pmod{p-1}$$

$$a \equiv (x_2 - y_2)^{-1} (y_1 - x_1) \pmod{p-1}$$

Why is this not used in practice?

Because, even with small input there is a lot of calculations.

Hash Attacks

Birthday Attack

How many people should exist in a room such that the probability two people share the same birthday is approx 1/2?

There are 365 days in a year, and there are two people

Probability they share a birthday? $1/365$

Probability that they don't share the same birthday? $1-1/365$

What if there is three people?

$$(1 - 1/365)(1 - 2/365)$$

What if there is k people?

$$(1 - 1/365)(1 - 2/365)\dots(1 - (k - 1)/365) \approx e^{-k^2/2(365)}$$

Find k such that

$$1/2 \leq e^{-k^2/2(365)}, k = 23$$

Another Example

Take k things being chosen randomly from n possibilities (with replacement). Then the probability that no two choices are the same is $\approx e^{-k^2/2n}$

License Plate Example

How many cars are needed before it is likely that two cars have the same last three digits?

N=1000 possible endings

The probability should be: $e^{-k^2/2n} < 1/2$

$$\begin{aligned} e^{-k^2/2000} &< 1/2 \\ &= -k^2/1000 < \ln(1/2) \\ &= -\ln(2) - k^2 < -2000\ln(2) \\ -k^2 &> \ln(2) \\ k &> (2000\ln(2))^{-1/2} \approx 37 \end{aligned}$$

How Birthday Attack works:

Alice has a digital signature function $s(x)$
and a hash function $h(x)$

Alice signs a message using $s(h(x))^{**}$ This is preimage resistant, no one else will have the same x

Eve's goal is to have Alice sign a bad contract.

Eve drafts two contracts: 1 good and 1 bad

Eve wants to find 35 places (35 is a reasonable example number for a hash example) she can make a small change without changing the meaning of the message.

2^{35} good contracts and 2^{35} bad contracts
 2^{36} contracts total

Eve hashes all of them to find a collision. What is the probability of finding a solution?

Probability of number collisions: 2^{36} , $k = 2^{36}$

$e^{-k^2/2(n)}$, $n = 2^{60}$ digests, $k = 2^{36}$ contracts

$e^{-2^{72}/2^{61}} = e^{-2^{11}} = e^{-2048} \approx 10^{-800}$, which is a very small chance for collision

There will be a collision between a good contract and a bad contract.

Eve has two contracts

MG and MB

Eve gives MG to Alice, Alice signs it.

$s(h(MG))$

Alice has the valid signature, which is valid for both the good contract and the bad contract.

$h(MG)=h(mb)$, same signature is valid for both

How does Alice protect against this?

Eve chooses the MG using a specific method

If Alice makes a single change the hash of MB will not equal the hash of MG

So, Alice ultimately produces the final contract.
