# MATH 314 Spring 2018 - Class Notes 

02/27/2018
Scribe: Brian Roshal
Summary: Today in class, we covered Finite Fields and polynomials over finite fields.
Notes: If we are doing modular arithmetic modulo a prime number p , then every residue besides 0 is invertible.

Recall: a ring is a set of things that can be added, subtracted, multiplies (sometimes, divided).

Ex: Integers, Rational numbers, Real numbers, Integers mod n, Complex numbers, Square matrices, and Polynomials.

Definition: a ring where every element is invertible besides 0 is called a field.

Rational Numbers: $\mathbb{Q}$
Real Numbers: $\mathbb{R}$
Complex Numbers: $\mathbb{C}$
Integers modulo p, p is prime:
We call a field with finitely many things in it a Finite Field
Fact: For any integer n, there exists at most one field with exactly $n$ elements in it. If it exists, we call is $\mathbb{F}_{\mathrm{n}}$

Note: If $n$ is not prime, then $\mathbb{F}_{\mathrm{n}}$ is not the integer mod $n$.
$\begin{array}{llll} \\ + & 1 & 2 & 3\end{array}$
$\begin{array}{lllll}0 & 0 & 1 & 2 & 3\end{array}$
$\begin{array}{lllll}1 & 1 & 2 & 3 & 0\end{array}$
$\begin{array}{lllll}2 & 2 & 3 & 0 & 1\end{array}$
$\begin{array}{lllll}3 & 3 & 0 & 1 & 2\end{array}$
$\begin{array}{lllll}\mathrm{x} & 0 & 1 & 2 & 3\end{array}$
$\begin{array}{lllll}0 & 0 & 0 & 0 & 0\end{array}$

| 1 | 0 | 1 | 2 | 3 |
| :--- | :--- | :--- | :--- | :--- |

$\begin{array}{lllll}2 & 0 & 2 & 0 & 2\end{array}$
$\begin{array}{lllll}3 & 0 & 3 & 2 & 1\end{array}$

The row of 2 is not a field because 2 is not invertible
Start with $\mathbb{F}_{2}[\mathrm{x}]$, this is the set of all polynomials with coefficients in $\mathbb{F}_{2}$.
Ex: $g(x)=x^{3}+x+1$
$f(x)=x^{2}+x$
Compute $f(x)+g(x)$
$f(x)+g(x)=x^{3}+x^{2}+2 x+1=x^{3}+x^{2}+1$
In this example, $\bmod =2$, multiplying by 2 is equivalent to multiplying by 0 .
Weird fact: in $\mathbb{F}_{2}[\mathrm{x}]$, addition and subtraction are the same thing. $f(x)+g(x)=f(x)-g(x)$
$f(x) \cdot g(x)=\left(x^{2}+x\right)\left(x^{3}+x+1\right)$
$=\left(x^{5}+x^{3}+x^{2}\right)+\left(x^{4}+x^{2}+x\right)$
$=x^{5}+x^{4}+x^{3}+2 x^{2}+x$
$=x^{5}+x^{4}+x^{3}+x$
So $\mathbb{F}_{2}[\mathrm{x}]$ is a ring, even though we can't do division, we can still do division with remainder.
We want the remainder to be a polynomial who's size and degree is smaller than the quotient.
Divide $g(x)$ by $f(x)$ with remainder
$\left(x^{3}+x+1\right) /\left(x^{2}+x\right)=x+1 R 1$
$x^{3}+x+1 \equiv 1\left(\bmod x^{2}+x\right)$
Ring: Integers modulo a prime number $p \rightarrow$ Field $\mathbb{F}_{\mathrm{p}}$
Ring: Polynomials mod 2 modulo an irreducible polynomial $p(x)$ of degree $n \rightarrow$ Field $\mathbb{F}_{2^{\mathrm{n}}}$ arithmetic mod 2.

Say $p(x) \in \mathbb{F}_{2}[x]$ is irreducible, if the only polynomial of smaller degree that evenly divides it is 1 . Let's find $\mathbb{F}_{4}$
Claim that $p(x)=x^{2}+x+1$ is irreducible
Check $\left(x^{2}+x+1\right) /(x)=x+1 R 1\left(x^{2}+x+1\right) /(x+1)=x R 1$
Arithmetic mod $x^{2}+x+1$

|  | + | 0 | 1 | x | $\mathrm{x}+1$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 1 | x | $\mathrm{x}+1$ |  |
| 1 | 1 | 0 | $\mathrm{x}+1$ | x |  |
| x | x | $\mathrm{x}+1$ | 0 | 1 |  |

$$
\begin{array}{lllllll}
\mathrm{x}+1 & \mathrm{x}+1 & \mathrm{x} & 1 & 0 \\
& & & & & & \\
& \mathrm{x} & 0 & 1 & \mathrm{x} & \mathrm{x}+1 & \\
0 & 0 & 0 & 0 & 0 & & \\
1 & 0 & 1 & \mathrm{x} & \mathrm{x}+1 & \\
\mathrm{x} & 0 & \mathrm{x} & \mathrm{x}+1 & 1 & \\
\mathrm{x}+1 & 0 & \mathrm{x}+1 & 1 & \mathrm{x} &
\end{array}
$$
