3DES(triple encrytion): It is secure against a meet in the middle attack.
$3 \mathrm{DES}(\mathrm{P})=\mathrm{E}_{3}\left(E_{2}\left(E_{1}(P)\right)\right)=C$
$E_{K 2}\left(E_{K 1}(P)\right)=D_{K 3}(C)$
$2^{112}$ entries $E_{K 1}(P)=D_{K 2}\left(D_{K 3}(C)\right)$
112 bits of effective security.
3DES uses 2 keys $\left(\mathrm{K}_{1}, K_{2}\right)$
$3 \mathrm{DES}(\mathrm{P})=\mathrm{E}_{K 1}\left(E_{K 2}\left(E_{K 1}(P)\right)\right)=C$
Try to do a meet in the middle attack
$\mathrm{D}_{K 2}\left(E_{K 1}(P)\right)=D_{K 1}(C) \ldots . .1$
$\mathrm{E}_{K 1}(P)=E_{K 2}\left(D_{K 1}(C)\right) \ldots . .2$
Either case has two keys on one side of equation.

3DES is still used in practice today but recommended against.
Modes of Operation:
$\rightarrow$ How to encrypt things larger than block size.
Electronic Codebook (ECB)
$\rightarrow$ Break the message into blocks, encrypt each block seperately to get the ciphertext.

Cipher block chaining (CBC)
$\rightarrow$ Start with some $C_{0}$ (this is a random strig) can be sent in clear text.
Break plaintext into blocks $P_{1}, P_{2} \ldots \ldots . P_{k}$
$\rightarrow$ Ciphertext $C_{i}=\mathrm{E}_{k}\left(P_{i} \oplus \mathrm{C}_{i-1}\right)$ (Even if all of the blocks $P_{i}$ are the same, the ciphertext $C_{i}$ will all be different)

To decrypt cipher block $C_{i}$
$\rightarrow \mathrm{i}=\mathrm{D}_{k}\left(C_{i}\right) \oplus \mathrm{C}_{i-1}$

Cipher-feedback(CFB)
$\rightarrow$ define some notation
head $(P)=$ First $n$ bits of the string $P($ DES- $n=8$, SDES $n=4)$
tail $(\mathrm{P})=$ everything after head
head $(101100101110)=1011$
tail(" 101100101110 ") $=00101110$
Write $\mathrm{A}|\mid \mathrm{B}$ means concatenate these strings together.
CFB
$\rightarrow$ Fix an initial $X_{1}$ (can be sent in cleartext)
$\mathrm{O}_{i}=\operatorname{head}\left(E_{k}\left(\mathrm{X}_{i}\right)\right) \rightarrow(8 \mathrm{bits})$
$C_{i}=O_{i} \oplus P_{i} \rightarrow(8$ bits $) \leftarrow$ Encryption is like the one time pad. DES is used as a random number generator.
$X_{i+1}=\operatorname{tail}\left(\mathrm{X}_{i}\right) \| C_{i} \rightarrow(64 \mathrm{bit})$
In this case our plaintext is broken into smaller blocks ( 8 bits for DES, 4 bits for SDES )

Output-feedback (Doesn't have problems of error propogation)
$\rightarrow$ Same idea as CFB
$\mathrm{O}_{i}=\operatorname{head}\left(E_{k}\left(X_{i}\right)\right)$
$C_{i}=P_{i} \oplus O_{i}$
$\mathrm{X}_{i+1}=\operatorname{tail}\left(X_{i}\right) \| O_{i}$
Sometimes, thisiscalledastreamcipher.
The $\mathrm{O}_{i_{s}^{\prime}}$ can be precomputed(Don't depend on ciphertext.)
OFB is much faster as a result(at the cost of some security.)
Counter (CTR)
$\rightarrow$ Start with any $X_{0}$ (can be sent cleartext)
$X_{i}=X_{i-1}+1\left(\bmod 2^{b}\right): b \rightarrow$ blocksize
$C_{i}=P \oplus E_{k}\left(\mathrm{X}_{i}\right)$
Take home message : ECB $\rightarrow$ is usually not a good choice for encryption. Pick a different mode of operation.

## AES(Advanced Encryption Standard)

$\rightarrow$ NIST put out a call for proposals to replace DES in the 90s.
The system chosen was rijndael.
This was established as the new standard for data encryption.
Not a feistel cipher
$\rightarrow$ Unlike DES the design of AES is completely open to make sure there are no hidden back door.

We'll describe SAES (Simplified AES)
$\rightarrow 2$ rounds( + initial add round key)

Diagram for SAES

## Ciphertext

Plaintext and master key are 16 bits in SAES.
Only 1 sbox and it is created using a known formula (takes in 4 bits and output 4 bits)
Take in 4 bits. use them to write a polynomial in $\mathrm{F}_{16}$ $F(x)=\mathrm{b}_{0} X^{3}+b_{1} X^{2}+b_{2} X+b_{3}$ Work (modulo $X^{4}+\mathrm{X}+1$ )
$\rightarrow$ First we find the inverse of this polynomial in $\mathrm{F}_{16}$ $\left(\mathrm{b}_{0} X^{3}+b_{1} X^{2}+b_{2} X+b_{3}\right)^{-1}=\mathrm{C}_{0} X^{3}+C_{1} X^{2}+C_{2} X+C_{3}$ write these 4 -bit as a vector

$$
\left(\begin{array}{c}
\mathrm{C}_{0} \\
C_{1} \\
C_{2} \\
C_{3}
\end{array}\right)^{4-1}
$$

Multiply on the left by a matrix and add another vector.

$$
\left(\begin{array}{l}
1011 \\
1101 \\
1110 \\
0111
\end{array}\right)\left(\begin{array}{l}
\mathrm{C}_{0} \\
C_{1} \\
C_{2} \\
C_{3}
\end{array}\right)+\left(\begin{array}{l}
1 \\
0 \\
0 \\
1
\end{array}\right)=\left(\begin{array}{l}
\mathrm{d}_{1} \\
d_{2} \\
d_{3} \\
d_{4}
\end{array}\right)
$$
