

MATH 314 Spring 2018 - Class Notes

2/26/2019

Scribe: Caitlin Nanashko

Summary: Today's class covered the Chinese Remainder Theorem

Notes: Chinese Remainder Theorem (CRT)

- If m and n are coprime ($\gcd(m, n) = 1$) then the equations $x \equiv a \pmod{m}$ and $x \equiv b \pmod{n}$ have a unique solution \pmod{mn} for any $a + b$

Example 1: Find a solution to $x \equiv 3 \pmod{7}$ and $x \equiv 12 \pmod{13}$.
CRT says there is a solution $\pmod{91}$

$x \equiv 3 \pmod{7}$ means $x = 3 + 7k$ for some integer k

plug this into $x \equiv 12 \pmod{13}$

$$3 + 7k \equiv 12 \pmod{13}$$

$$7k \equiv 9 \pmod{13}$$

Need $7^{-1} \pmod{13}$

$$7^{-1} \equiv 2 \pmod{13}$$

$$2(7k) \equiv 2(9) \pmod{13}$$

$$k \equiv 18 \pmod{13}$$

$$k \equiv 5 \pmod{13}$$

- If $n = ab$ where $\gcd(a, b) = 1$ then if $x \pmod{n}$ is invertible and $x \pmod{a}$ and $x \pmod{b}$ are invertible

φ is greek letter phi you could also see it as ϕ

- Using the CRT we can take any invertible residue \pmod{a} and one \pmod{b} and find a unique solution to both \pmod{n} that is also invertible

$\varphi(a)$ invertible residue \pmod{a}

$\varphi(b)$ invertible residue \pmod{b}

$$\varphi(n) = \varphi(a)\varphi(b) \text{ if } n = ab \text{ and } \gcd(a, b) = 1$$

$$\varphi(25) = \frac{4}{5}(25) = 4 * 5 = 20$$

$$\varphi(125) = (5^3) = \frac{4}{5}(125) = 4 * 25 = 100$$

$$\varphi(p^2) = \frac{p-1}{p}(p^2)$$

$$\begin{aligned}\varphi(120) &= \varphi(5) * \varphi(24) \\ &= \varphi(5) * \varphi(3) * \varphi(2^3) = (5-1)(3-1)(2-1)(2^2) \\ &= (4)(2)(1)(2^2) = 32\end{aligned}$$

Fuler's Theorem: if a is coprime to n then $a^{\varphi(n)} \equiv 1 \pmod{n}$

Note: if $n = p$ is prime then $\varphi(p) = p - 1$ $a^{p-1} \equiv 1 \pmod{p}$

Example: Compute $7^{17} \pmod{15}$

Use Eucler's Theorem $\varphi(15) = \varphi(3)\varphi(5) = (3-1)(5-1) = 8$

$$\begin{aligned} &= 7^8 \equiv 1 \pmod{15} \\ 7^{17} &\equiv 7^8 * 7^8 * 7^1 \equiv 7 \pmod{15}\end{aligned}$$

In a ring we can add, subtract, and multiply, but we can't always divide

Sometimes we have a ring where we can divide by everything except 0 these are **fields**.

Important fact about fields: there is at most one finite field with n elements for any n .
